

Contents

Part One: FOUNDATION	1
Chapter 1: IDENTIFYING TRUE REQUIREMENTS	3
1.1 Distinguishing between true and false requirements	3
1.2 The danger of false requirements	4
1.3 Defining requirements with structured analysis	5
1.4 Distinguishing between logical and physical	5
1.5 The scope of this book	8
1.6 Summary	9
Chapter 2: PLANNED SYSTEMS	10
2.1 Interactive systems	10
2.2 Planned response systems	12
2.3 Summary	14
Chapter 3: THE ESSENCE OF A SYSTEM: LOGICAL REQUIREMENTS	16
3.1 The concept of perfect technology	16
3.2 The components of a system's essence	17
3.2.1 <i>Fundamental activities</i>	17
3.2.2 <i>Essential memory</i>	18
3.2.3 <i>Custodial activities</i>	20
3.2.4 <i>Compound essential activities</i>	21
3.3 Summary	22
Chapter 4: THE INCARNATION OF A SYSTEM: PHYSICAL CHARACTERISTICS	23
4.1 The incarnation of essential features	25
4.2 The planned response system within the implementation	25
4.3 The impact of imperfect technology	29
4.3.1 <i>Fragmentation</i>	29
4.3.2 <i>Redundancy</i>	30
4.3.3 <i>Extraneousness</i>	30
4.3.4 <i>Convolution</i>	32
4.3.5 <i>Conglomeration</i>	32
4.3.6 <i>Vasiness</i>	32
4.4 Summary	33
Chapter 5: THE ESSENCE OF SYSTEM DEVELOPMENT	34
5.1 Imperfect system development technology	35
5.1.1 <i>Imperfect system development processors</i>	35
5.1.2 <i>Multiple system development processors</i>	36
5.1.3 <i>Planning and control activities</i>	36
5.1.4 <i>Quality control activities</i>	37
5.2 Essential system development activities	38
5.3 Summary	38

Chapter 6: SYSTEM MODELING	39
6.1 The benefits of modeling	40
6.2 The choice of a modeling approach	40
6.3 The principles of essential modeling	42
6.3.1 <i>The budget for complexity</i>	42
6.3.2 <i>Technological neutrality</i>	43
6.3.3 <i>Perfect internal technology</i>	44
6.3.4 <i>The minimal essential model</i>	45
6.3.5 <i>The benefits of the modeling principles</i>	46
6.4 Summary	46
Part Two: ESSENTIAL MODELING TOOLS AND STRATEGIES	47
Chapter 7: PARTITIONING THEMES FOR ESSENTIAL MODELS	49
7.1 Partitioning the system into essential activities	49
7.1.1 <i>Recognizing events</i>	49
7.1.2 <i>The event-partitioned system</i>	51
7.1.3 <i>The advantages of event partitioning</i>	56
7.2 Partitioning essential memory	57
7.2.1 <i>Objects</i>	57
7.2.2 <i>Object partitioning</i>	59
7.3 Problems with other partitioning themes	61
7.3.1 <i>The single data store partitioning solution</i>	61
7.3.2 <i>The data store for each element partitioning solution</i>	61
7.3.3 <i>The private component file partitioning solution</i>	64
7.3.4 <i>The benefits of object partitioning</i>	66
7.4 Leveling	66
7.5 Summary	68
Chapter 8: MODELING ESSENTIAL ACTIVITIES	69
8.1 Modeling the stimulus	69
8.1.1 <i>A stimulus from an external event</i>	69
8.1.2 <i>A stimulus from a temporal event</i>	71
8.2 Modeling the planned response	73
8.2.1 <i>Controlling the complexity of minispecifications</i>	74
8.2.2 <i>Avoiding false requirements</i>	74
8.2.3 <i>Redefining structured English</i>	75
8.2.4 <i>Using a nonsequential modeling tool</i>	75
8.3 Modeling planned response results	76
8.3.1 <i>Modeling external results</i>	77
8.3.2 <i>Modeling essential memory updates</i>	78
8.4 Modeling essential memory accesses	78
8.4.1 <i>Defining an essential memory access</i>	79
8.4.2 <i>Modeling essential memory accesses in minispecifications</i>	80
8.4.3 <i>Modeling essential memory accesses on the DFD</i>	80
8.4.4 <i>Modeling accesses with the data dictionary</i>	81
8.5 Summary	84
Chapter 9: MODELING ESSENTIAL MEMORY	85
9.1 Modeling data elements	85
9.2 Modeling objects	86
9.2.1 <i>Modeling large objects</i>	87
9.2.2 <i>Intra-object relationships</i>	92
9.3 Modeling interobject relationships	93
9.3.1 <i>Data structure diagrams</i>	94
9.3.2 <i>Entity-relationship diagrams</i>	95
9.3.3 <i>Minispecifications</i>	96

9.4	Choosing the right approach	96
9.4.1	<i>Interobject relationship modeling vs. essential access modeling</i>	97
9.4.2	<i>Global models vs. local models</i>	97
9.4.3	<i>Specialized models vs. general models</i>	98
9.4.4	<i>Requirement models vs. semantic models</i>	98
9.4.5	<i>Graphic models vs. narrative models</i>	98
9.5	The need for a better convention	99
9.6	Summary	100
Chapter 10: STRATEGIES FOR MODELING THE ESSENCE OF A SYSTEM		101
10.1	Creating the new essence	102
10.1.1	<i>First decision: identifying the system's purpose</i>	102
10.1.2	<i>Second decision: identifying fundamental activities</i>	103
10.1.3	<i>Third decision: identifying required information</i>	104
10.1.4	<i>Fourth decision: identifying custodial activities</i>	105
10.2	Modeling the new essence	106
10.3	Deriving the new essence	108
10.3.1	<i>Why derive the essence?</i>	108
10.3.2	<i>Why model the current incarnation?</i>	109
10.4	Choosing a modeling strategy	112
10.4.1	<i>Factors in choosing a modeling strategy</i>	112
10.4.2	<i>The reasons for our choice of strategy</i>	115
10.5	Summary	115
Part Three: THE ANATOMY OF EXISTING SYSTEMS		117
Chapter 11: THE ANATOMY OF SINGLE PROCESSOR SYSTEMS		119
11.1	Processors	119
11.2	Single processor/single essential activity systems	121
11.2.1	<i>Essential activities</i>	123
11.2.2	<i>Internal quality control activities</i>	124
11.2.3	<i>Internal transportation activities</i>	124
11.3	Optimizing processor performance	125
11.4	Single processor/multiple essential activity systems	127
11.5	Summary	127
Chapter 12: THE ANATOMY OF MULTIPLE PROCESSOR SYSTEMS		128
12.1	The fragmentation of essential activities among processors	128
12.1.1	<i>Fragmentation according to processor skill and cost</i>	129
12.1.2	<i>Fragmentation according to processor capacity and cost</i>	131
12.2	The interprocessor infrastructure	133
12.2.1	<i>Sharing stored data</i>	133
12.2.2	<i>Communicating intermediate products</i>	145
12.3	The interprocessor administration	148
12.4	Summary	150
Chapter 13: THE CONSOLIDATION OF SYSTEM ACTIVITIES		151
13.1	Consolidation of essential activity fragments	151
13.2	Consolidation of nonessential system activities	152
13.2.1	<i>Consolidation of the infrastructure</i>	154
13.2.2	<i>Consolidation of data stores</i>	157
13.2.3	<i>Consolidation of administrative activities</i>	158
13.2.4	<i>Consolidation of activities in a multiple processor system</i>	160
13.3	Nested processors	160
13.4	Superprocessor incarnations	165
13.5	Summary	167

Chapter 14: DISCOVERING THE ESSENTIAL SYSTEM THROUGH SYSTEM ARCHAEOLOGY	168
14.1 The discovery strategy	169
14.2 Finding and classifying the essential activity fragments	171
14.3 Modeling an essential activity	171
14.4 Integrating the essential activity models	171
14.5 Summary	172
Part Four: FINDING THE ESSENTIAL ACTIVITIES	173
Chapter 15: EXPANDING THE CURRENT PHYSICAL MODEL	175
15.1 Expanding the data flow diagrams	177
15.2 Expanding the data dictionary	181
15.3 Expanding the minispecifications	184
15.4 Feedback effects	186
15.5 A tranquilizer for expandophobes	187
15.6 Summary	187
Chapter 16: REDUCING THE EXPANDED PHYSICAL MODEL	188
16.1 Removing the interprocessor infrastructure	188
16.2 Removing the administration	197
16.3 Reconnecting the essential fragments	199
16.4 The results of the reduction process	201
16.5 Summary	201
Chapter 17: CLASSIFYING THE ESSENTIAL FRAGMENTS	202
17.1 Event partitioning revisited	204
17.2 Identifying external events	205
17.2.1 Naming external events	208
17.3 Identifying essential fragments for each external event	209
17.3.1 Identifying the system's complete response	215
17.4 Identifying temporal events	221
17.4.1 Naming temporal events	223
17.5 Identifying essential fragments for each temporal event	224
17.6 Building the initial essential model	226
17.7 Summary	229
Part Five: DEFINING AN ESSENTIAL ACTIVITY	231
Chapter 18: COMPLETING THE DERIVATION PROCESS: AN OVERVIEW	233
18.1 Partitioning the remaining work	233
18.1.1 The two-pass approach	234
18.2 The difference between creating and deriving	237
18.3 Summary	237
Chapter 19: RECOGNIZING REMAINING PHYSICAL CHARACTERISTICS	238
19.1 Physical characteristics of essential activity fragments	238
19.1.1 Fragmentation	238
19.1.2 Extraneousness	240
19.1.3 Redundancy	241
19.1.4 Convolution	241
19.1.5 Nonessential sequence	244
19.2 Physical characteristics of essential memory fragments	251
19.2.1 Fragmentation	252
19.2.2 Extraneousness	253
19.2.3 Redundancy and convolution	253
19.3 Physical names	254
19.4 Summary	254

Chapter 20: DERIVING AN ESSENTIAL ACTIVITY	255
20.1 Response-based derivation	255
20.2 Selecting an essential activity	257
20.3 Uncovering the core of the essential activity	257
20.4 Removing extraneous physical features	260
20.5 Consolidating the remaining fragments	265
20.6 Partitioning the essential memory	266
20.6.1 <i>Identifying objects</i>	267
20.6.2 <i>Attributing data elements to object data stores</i>	269
20.6.3 <i>Resolving attribution anomalies</i>	270
20.7 Minimizing the essential accesses	270
20.8 Establishing the essential order among the activities	276
20.9 Establishing the physical ring	276
20.10 Summary	278
Chapter 21: MODELING AN ESSENTIAL ACTIVITY	279
21.1 Creating the high-level essential activity model	280
21.2 Modeling the details of a small essential activity	281
21.3 Modeling the details of a large essential activity	283
21.4 Modeling interobject relationships	287
21.5 Summary	287
Part Six: INTEGRATING THE ESSENTIAL ACTIVITY MODELS	289
Chapter 22: INTEGRATING THE ESSENTIAL ACTIVITIES	291
22.1 Cross-checking essential accesses	291
22.2 Resolving missing custodial activities	293
22.3 Removing unnecessary custodial activities	295
22.4 Summary	298
Chapter 23: BUILDING A GLOBAL ESSENTIAL MODEL	299
23.1 Consolidating object data stores	300
23.2 Drawing a global data flow diagram	304
23.3 Remodeling derived essential memory	304
23.4 Factoring out common functions	307
23.5 The completely essential model	309
Chapter 24: REVIEWING THE QUALITY OF THE MODEL	310
24.1 Repartitioning data stores	311
24.2 Creating subminispecs	312
24.3 Building upper levels of data flow diagrams	314
24.4 Summary	317
Part Seven: MODELING THE NEW SYSTEM	319
Chapter 25: ADDING NEW ESSENTIAL FEATURES	321
25.1 Building mini-models	322
25.2 Defining new essential features	323
25.2.1 <i>When the users or analysts understand essential systems analysis</i>	323
25.2.2 <i>When the users or analysts don't know essential systems analysis</i>	325
25.2.3 <i>Integrating new essential requirements</i>	325
25.3 Understanding the psychology of new essential requirements	327
25.4 Summary	327
Chapter 26: SELECTING AN INCARNATION	329
26.1 An incarnation's general goals	329
26.2 Strategy for deriving an incarnation	329
26.2.1 <i>Specifying the external interface</i>	330

26.2.2	<i>Allocating essential activities to processors</i>	330
26.2.3	<i>Establishing the infrastructure</i>	331
26.2.4	<i>Establishing the administration</i>	336
26.2.5	<i>Optimizing the incarnation</i>	336
26.3	Summary	340
Chapter 27: CREATING A SOFTWARE DESIGN BLUEPRINT FROM THE INCARNATION MODEL		341
27.1	Designing hierarchical software	341
27.2	Transforming the network model into a hierarchical model	342
27.3	Applying structured design	342
27.4	Summary	345
Part Eight: MANAGING ESSENTIAL SYSTEMS ANALYSIS		347
Chapter 28: TIME: THE CRITICAL DEVELOPMENT RESOURCE		349
28.1	Why time is critical	349
28.2	How project time is wasted	350
28.2.1	<i>The current physical tarpit</i>	351
28.3	Summary	354
Chapter 29: OPTIMIZING THE PROCESS OF DEFINING ESSENCE		355
29.1	How the essential modeling framework saves time	355
29.2	Deviating from the idealized derivation approach	356
29.3	The optimized procedure: blitzing an essential model	357
29.3.1	<i>Establishing the system's purpose</i>	358
29.3.2	<i>Creating an essential context diagram</i>	358
29.3.3	<i>Creating lists of objects and events</i>	359
29.3.4	<i>Drafting the preliminary essential model</i>	361
29.4	Mopping up	361
29.4.1	<i>Blitzing a current physical model</i>	363
29.4.2	<i>Establishing an essential modeling plan</i>	364
29.4.3	<i>Building individual essential activity models</i>	365
29.4.4	<i>Integrating the essential activity models and performing the final pass</i>	366
29.5	Summary	366
Chapter 30: EFFECTIVE PROJECT MANAGEMENT: A LEVELED APPROACH		367
30.1	Leveled system development	369
30.2	Problems with the unleveled approach	371
30.3	The benefits of the leveled approach	371
30.4	Plumbing the depths of a detailed activity	372
30.5	Project scouts	372
30.6	Intermediate levels of development	374
30.7	Summary	374
Chapter 31: PLANNING LONG PROJECTS: THE PROJECT AS MOVING TARGET		375
31.1	Destructive external factors	375
31.2	Sitting duck projects	376
31.3	Turning a sitting duck into a moving target	377
31.4	Model-based project planning	377
31.5	Summary	380
Afterword		381
Bibliography		383
Index		387
